

How to Update Your Website — Simple Guide

This guide is for you, not a developer. No coding needed. Just follow the steps in order.

The short version

1. Open the editor tool (in Chrome or Edge).
2. Give it permission to see your project folder.
3. Click the section you want to change, edit it, click Save.
4. Publish your changes so they go live.

That's it. Details below.

Step 1: Open the editor tool

The editor (“admin panel”) only works in **Google Chrome** or **Microsoft Edge** — not Firefox, not Safari.

Open this link in Chrome or Edge:

<https://farukuzzamanfaruk.github.io/admin/>

You'll see a dark sidebar on the left and a button that says “**Open Project Folder**”.

Step 2: Give it access to your project folder

1. Click “**Open Project Folder**”.
2. A window pops up asking you to choose a folder. Select your project folder:
D:\ULL PhD\9. Web Development\FARUK Personal Portfolio
3. Click “**Select Folder**” / “**Allow**” if your browser asks to confirm.

You only need to do this once per browser session. If you close the tab and come back later, just repeat this step.

This never uploads anything anywhere — it only reads/writes files on your own computer, in that folder.

Step 3: Pick what you want to change

The left sidebar lists every part of your site:

Sidebar item	What it controls
Profile	Your name, photo, tagline, objective, CV, emails, social links
Education	Your degrees
Experience	Your jobs/teaching roles
Publications	Your papers
Awards & Honors	Awards, certificates, their photos
Gallery	Conference/event photos
Funded Projects	Your research projects
News & Updates	The “latest news” cards on your site
Skills	Research interests, languages, frameworks
Professional Service	Committees, consultancy, etc.

Click any item to open it.

Step 4: Make your changes

For Profile/Skills/Service (a single form): just edit the text boxes directly.

For everything else (a list — Education, Publications, Awards, etc.): - To **add** something new: click “+ **Add new**”, fill in the form, click “**Save entry**”. - To **change** something existing: find it in the table, click **Edit**, change the text, click “**Save entry**”. - To **remove** something: find it in the table, click **Delete**, confirm.

To add or change a photo (Profile, Awards, Gallery): click “**Choose File**” next to the photo field and pick any image from your computer — it gets copied in automatically.

Step 5: Save

Every form has a **Save** button — click it after each change. You’ll see a small confirmation message in the top-right corner.

You can make several changes across different sections before publishing — you don’t have to publish after every single edit.

Step 6: Publish (make it go live)

Editing and saving only updates the files on your computer — your public website won’t change until you **publish**.

Easiest way: just tell Claude Code (in a terminal / this app), in plain English:

“Please publish my portfolio changes.”

Claude will handle the rest and let you know once it's live (usually live within 1-2 minutes, sometimes longer during GitHub's busier periods).

Or, do it yourself: click **"Copy publish commands"** in the sidebar, open a terminal in your project folder, paste, and press Enter. It runs three commands that save and upload your changes.

Quick answers to common questions

"I published a new paper — how do I add it?" → Admin panel → **Publications** → **+ Add new**. Fill in Title, Authors (wrap your own name in ****two asterisks**** so it's bold), Venue, Year, etc. Save, then publish.

"I want to post a news update." → Admin panel → **News & Updates** → **+ Add new**. Newest entries should go visually to the top automatically based on order — just add it and it'll appear correctly.

"I got a new award/certificate — how do I show it?" → Admin panel → **Awards & Honors** → **+ Add new**. Fill in the title and upload the certificate photo. Save, then publish.

"I want to change my profile photo." → Admin panel → **Profile** → click "Choose File" under Profile Photo → pick the new photo. Save, then publish.

"I want to update my CV." → Replace the PDF file at `assets/cv/CV_FARUK.pdf` in your project folder with your new CV (keep the same file name), then publish. (Or ask Claude to do this for you — just hand over the new PDF.)

"Something looks wrong on the live site after I published." → Give it a minute or two — GitHub sometimes takes a little while to update. If it's still wrong after 5 minutes, ask Claude to check.

If you get stuck

Just ask Claude Code. You can say things like: - "Add this new publication for me: [paste details]" - "Update my CV with this new file" - "Something's not showing up right on my website, can you check?"

You don't need to use the admin panel yourself at all if you'd rather just hand Claude the new information — either way works.
